

# Global Data Compliance Mandate (GDCM v4.2)

*Document ID: GDCM-2026-ALPHA-042 | Version: 4.2 | Date: May 2026 | Author: Onyx Global Governance Board*

---

## Section 1: Purpose & Jurisdiction

This document outlines the strict regulatory compliance directives governing global distributed information structures and cognitive multi-agent processing systems. Under Section 14.1 of the Accord on Digital Sovereignty, all entities deploying automated data-routing systems must enforce local data residency constraints.

The goal of GDCM v4.2 is to establish unified protocols for zero-leakage cognitive processing, protecting customer financial interests, institutional integrity, and national security boundaries in an era of autonomous agent routing.

## Section 2: AI Multi-Agent Processing Standards

Operational cognitive agents must not persist context memory blocks across distinct organizational domains. Any transient agent interaction must be encrypted via standard AES-GCM-256 protocols.

No agent may act as a relay for unverified credentials, and all inter-agent messages must carry authenticated headers specifying the transaction's originating client ID and security token.

## Section 3: Spatial Data Sovereignty Limits

All physical data hosts and local vector database indexes mapping user compliance data must operate within strict geographical boundaries.

Automated cross-border intelligence compilation is strictly prohibited unless routed through certified, low-latency zero-knowledge relays that verify data sovereignty compliance in real-time.

## Section 4: Strict Zero-Retention Tokens

Customer authentication passphrases and security key exchanges must employ zero-retention temporary tokens.

Session variables must be discarded from active memory tables immediately upon session termination, preventing background memory persistence from exposing sensitive institutional data structures.
